

# Connection

## May 2026

We believe that experienced, reputable, and fast responding IT support should be the standard!

### Our Services:

- Data Backup & Recovery
- Managed Services
- IT Consulting
- Network Security
- Cloud Computing
- Remote IT Services
- Cyber Security Training
- Mobile Device Management
- VoIP Phones
- Co-Managed IT

# \* Password Managers Explained \*

### What is a password manager?

A password manager is a tool designed to generate, store, and organize your login credentials across multiple devices. Instead of keeping track of dozens of usernames and passwords on your own, the software does it for you. There are many options available, ranging from free to premium, each offering slightly different features.

### How does it work?

Password managers store your credentials in an encrypted vault that's protected by a single "master password." Once you unlock the vault, the manager can automatically log you into websites and apps.

When you create a new account, the password manager can generate a strong, unique password and save it instantly. Most tools also offer autofill features, allowing you to log in or complete online forms with just a click. In addition to passwords, many managers can securely store personal details like your name, address, phone number, and even payment information for faster checkout.

### Should you use a password manager at work?

The short answer: follow your organization's policy. Some companies provide approved password managers, while others prohibit their use. Never install or use unapproved software on a work device, as this can introduce security risks and violate company guidelines.

### Should you use one personally?

For most people, the answer is yes. Keeping track of dozens of complex passwords is unrealistic without help. Password managers simplify this by requiring you to remember just one strong master password, while securely handling the rest.

### Are password managers secure?

There are two sides to consider. On one hand, a password manager can be seen as a "single point of failure" since it stores many of your credentials in one place. If a provider were ever compromised, it could potentially expose a large amount of data. While such incidents have occurred, they are relatively rare.

On the other hand, password managers significantly improve everyday security. They encourage the use of strong, unique passwords for every account and eliminate risky habits like password reuse or writing credentials down. Because of this, most cybersecurity professionals agree that the benefits outweigh the risks when using a reputable provider and a strong master password.

### Bottom line

Password managers are one of the simplest ways to improve your digital security. Used correctly, they make your online life both safer and more convenient.

# What's NEW at CSU?

## Sun-Bathe Faye

Sunbathing season is officially here! After seeing many concerned neighbors, we figured a sign was necessary... Don't worry – our Faye is just perfecting her tan!

Leo has been a little needy... You've heard of lap dogs? Well here is a desk cat!

*Happy Mother's Day to our CSU momma's!*

**DID YOU KNOW...**

McDonald's isn't good for passwords McDonald's recently revealed that passwords like "bigmac," "happymeal," and "mcnuggets" have appeared in more than 110,000 compromised accounts. Even swapping letters for numbers doesn't help much anymore. Modern hacking tools automatically test common substitutions, so "Mcnugg3ts!" is just as predictable as the original. The safest approach today is to use long, random passwords stored in a password manager, combined with multifactor authentication. If your business still relies on memory alone, it's time for an upgrade.

**Insta360 Link 2C**

You're about to jump on an important video call. It could be a new client. A supplier. Maybe even your biggest prospect of the year. You open your laptop and there you are. Grainy, blurry and backlit like you're in witness protection. Not ideal. That's where the Insta360 Link 2C steps in. This isn't just another webcam. It records in true 4K with a large sensor, so you look sharp and professional even in tricky lighting. Builtin AI noise canceling keeps your voice clear by filtering out background distractions. And fast auto focus means no more blurry moments when you move. Studio-quality presence. No studio required.
